# Captive Portal API State Structure Enhancement

---

## Abstract

This document specifies a new key in Captive Portal API State data structure. The purpose of the new key is to allow clients to perform the client authentication without user interaction.

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 27 December 2024.

## 1. Introduction

As described in [RFC8908], the Captive Portal API data structure is specified in JavaScript Object Notation (JSON) [RFC8259]. Requests and responses for the Captive Portal API use the "application/captive+json" media type. The original specification specifies key "user-portal-url" to convey the web portal URL to the client. Although in most cases client devices are capable of presenting the web portal to the user, there are types of devices that are not built to support the user interaction with the web portal. This document specifies a new key that allows client to perform the authentication without user interaction.

## 2. Conventions and Definitions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

## 3. API State Structure Enhancement

Table 1 shows the new key that can be optionally included in the top-level of the JSON structure returned by the API server.

Key	Type	Description
authentication-server-url	string	It provides the URL of the Authentication Server that MUST be accessed over TLS. Authentication Server authenticates clients using the HTTP authentication framework specified in [RFC9110]. The server MUST NOT require user interaction on the client device. The client MUST have a credential to perform the authentication without user interaction.

## 4. Security Considerations

This document recommends security considerations specified in [Section 7](#) of [RFC8908].

## 5. Privacy Considerations

This document recommends privacy consideration specified in [Section 7.1](#) of [RFC8908].

## 6. IANA Considerations

IANA is requested to add the new key specified in Table 1.
